Product description

The device allows for easy diagnosis and quick to detect broken head gasket. In the case of a damaged head gasket or the head of the exhaust gas. containing, among others CO2 goes to the cooling system. The principle of operation is based on the measurement of CO2 content in the cooling system. The reaction liquid in the chamber tester will react with the gases from the cooling system and for increased levels of CO2 will change color. Double chamber design of the instrument (with a filter between the chambers) allows for separate residues in the first chamber (for example, drops of coolant). which could adversely affect the test result.
